

Introducing SSVC, the Latest Assessment Method for the Ongoing Vulnerability Management Service FutureVuls **Full automation, from risk-based “response decisions” to “response instructions”**

Future Corporation
TOKYO, Japan, September 14, 2022 / Future Corporation

On September 13, 2022, Future Corporation (Headquarters: Shinagawa-ku, Tokyo; Chairman and President, Group CEO: KANEMARU Yasufumi) released FutureVuls, a vulnerability management tool originally developed for enterprises, with an automatic triage engine based on the new vulnerability assessment framework SSVC (Stakeholder-Specific Vulnerability Categorization).

FutureVuls is a solution based on the Open Source Software (OSS) Vuls, which automatically scans vulnerability information and enables centralized vulnerability management, including detection of system vulnerabilities, information collection, response decisions, task management, and patching. It is used around the world, and at one point was even #1 on GitHub Trending.

The newly introduced SSVC is an index proposed by Carnegie Mellon University in the United States. Since it can derive the level of on-site response that should be taken across four stages, triage work, which takes the most time in vulnerability response, is automated, significantly reducing the load. In addition, the urgency of a response can be determined instantly even without specialized knowledge of risk judgment, and response instructions for each degree of urgency can be automated, enabling speedy and stable vulnerability management operations.
